

## Geological Survey professional paper Volume 425-426

Filesize: 4.12 MB

### Reviews

*Definitely one of the better publication I have got possibly read. It really is written in basic phrases and not difficult to understand. You wont sense monotony at anytime of your respective time (that's what catalogs are for about if you request me).*

*(Daron Lowe)*

## GEOLOGICAL SURVEY PROFESSIONAL PAPER VOLUME 425-426

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 62 pages. Dimensions: 9.7in. x 7.4in. x 0.1in. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1987 Excerpt: . . . P. Ta, W, U. Re. XI. Pt. It. Pd. Ag. Au. Zn. Cd. Hg. In. Ti. Oe, As. Sh. Bl, Te. B. Compared with the average of analyses of igneous rocks in the complex (table 46), the analyzed rock is lower in MgO, FeA, FeO, MnO, CaO, BaO, TiO<sub>2</sub>, C0<sub>2</sub>, P2O<sub>5</sub>, Cl, F, S, and higher in SiO<sub>2</sub>) A12O<sub>2</sub>, NaA KA SO<sub>3</sub>. Trace elements in the rock that are equal to or exceed 0. 01 percent include: Sr, Ba, La, Zr, V, Nb, and Mn. Spectrographic analyses of several minerals hand picked from the coarse to very coarse pegmatite, table 34, show that Sr, Ba, Sn, Pb, Nb, and La are concentrated in eudialyte. La also occurs in pectolite and tobermorite; V and Zr occur chiefly in aegirine; Ga is in microcline. Table 36. --Analyses of garnet fourchite, in percent GARNET FOURCHITK Garnet fourcbitc occurs in the southwestern part of sec. 18, where the saprolite and float pattern suggest a small dike that cuts fine-grained ijolite and analcime olivine melagabbro. The rock is a dark-gray porphyritic aphanite in which phenocrysts of pyroxene comprise 20 to 40 percent of the rock. It weathers to a light greenish-brown saprolite with black spots. In thin section the augite phenocrysts are a very pale brown in color and appear zoned only under crossed nicols. They are set in a xenomorphic-granular groundmass of brown to colorless garnet--about 18 percent; magnetite-ilmenite rimmed with sphene--about 23 percent, analcime()--about 8 percent, nepheline partially altered...
